It has been available for Windows since AutoCAD 2002, and for macOS since AutoCAD 2014. It is one of the more popular and widely used CAD/drafting tools for architectural and mechanical design professionals. It is available for both professional and student use. In 2017, Autodesk replaced AutoCAD 2016 with AutoCAD 2017, which provides significant improvements to the application. The application has become an industry standard, and is widely used by both professional and amateur CAD users, by architects, mechanical and civil engineers, product designers, land surveyors, map editors, and artists. Other industries that use the software include: research and development, government, education, the media, music, film and television, fashion, the automotive industry, construction, real estate, and engineering and manufacturing. AutoCAD is available in both a single-user and multi-user (network) version. The single-user version includes a primary (Main) user and one or more additional secondary (Helper) users. The helper users are useful when using two-dimensional and 3D drawings. The design interface is similar to AutoCAD LT, although not exactly the same. The general purpose drawing workspace consists of various toolbars, draw and text boxes, and a path tool. The GUI and text editing features are similar to those in AutoCAD LT. Multiple objects can be created on the drawing canvas at the same time. The program is a standalone application, meaning that it is not required to have an AutoCAD LT license in order to install and use AutoCAD. Users who use AutoCAD LT software at a certain job site may need to log in to the site's local

Inflammatory breast carcinoma: a review of 12 cases treated at Stanford University Medical Center. This retrospective analysis of 12 patients with metastatic inflammatory breast cancer treated at Stanford University Medical Center documents the outcomes of a recently introduced regimen consisting of paclitaxel, doxorubicin, and carboplatin. All patients were women with a median age of 52 years (range, 35 to 68). Five had stage IV disease, five had stage III disease, and two had stage II disease. All but one patient with stage IIIA disease had initially undergone radical mastectomy. Paclitaxel, 175 mg/m², doxorubicin, 60 mg/m², and carboplatin, 300 mg/m², were administered every 3 weeks. Prior therapy consisted of local radiation (five patients), tamoxifen (five), and other agents (two). Granulocyte colony-stimulating factor was used as a support agent in six of nine patients (67%) with severe neutropenia. No patient had a complete response, and seven patients had progressive disease (six of whom had disease progression within 4 weeks after the initial cycle). No patient survived more than 15 months from diagnosis. Median survival was 2.6 months (range, 0.8 to 15.7). The most frequent toxicity was neutropenia, occurring in seven patients. Other toxicities included nausea and vomiting, anemia, and neuropathy. Neutropenic fever occurred in two patients. This study confirms the difficulty in treating patients with metastatic inflammatory breast cancer and shows that the response
